x   f(x)

agent akan mencari hampiran output dari data yg ada krn bisa aja ada info yg ga ada di data.

Supervised Learning

Learning a (possibly incorrect) general function from specific input-output pairs is called <u>inductive learning</u> ⟶ belum tentu benar (dr khusus ke umum)

I/O pairs
Training set
<data, label>

"guru"nya

Inductive Learning

Hypothesis h
$h \approx f$

Target function f: data ⏴ label

Classification: domain (label) is a finite set of values
Regression: domain (label) is numeric (continuous value)

Unseen data

Predict

label

Fish Packing Plant

- Fish packing plant wants to automate the process of sorting incoming fish on a conveyor belt according to species.

- A: Conveyor belt for fish
- B: Conveyor belt for classified fish
- C : Robot arm for grabbing fish
- D: Machine vision system with CCD camera
- E : Computer that analyze fish image and control the robot arm

(d) CCD Camera

(b) Conveyor belt (Salmon)

(e) Computer

Robot Arm

(c)

(a) Conveyor belt

(b) Conveyor belt (Sea Bass)

Fish features

- Piksel
- Descriptor based on : color, shape, textures

Find physical differences between the two types of fish:
- Length
- Lightness
- Width
- Number and shape of fins
- Position of the mouth,
- …

(a)   (b)

Tentative Model: Length Feature

Suppose somebody at the fish plant tells us that a sea bass is generally longer than a salmon.
From histograms, sea bass are longer than salmon, on average, but it is clear that this single criterion is quite poor;

No matter how we choose l∗, we cannot reliably separate sea bass from salmon by length alone.

The value l∗ marked will lead to the smallest number of errors, on average.

Tentative Model: Lightness Feature
The resulting histograms are much more satisfactory — the classes are much better separated.

Misclassification

salmon in "sea bass" cans vs sea bass in "salmon" cans ?

# Tentative Model: Lightness and Width Feature

lightness	width	category
1.5	14.6	salmon
7.3	15	Sea bass
...		

Fish ➡ $x^T = [x_1, x_2]$

Lightness   Width

Rule based on 2 Features
$Y=a*width+b*lightness+c$

Given decision boundary, the following rule for separating the fish: Classify the fish as sea bass if its feature vector falls above the decision boundary shown, and as salmon

Tentative Complex Model: Training Accuracy 100%

- While such a decision may lead to perfect classification of our training samples, it would lead to poor performance on future patterns.
- The novel test point marked ? is evidently most likely a salmon, whereas the complex decision boundary shown leads it to be misclassified as a sea bass.

Optimal Model: Better Generalization
The decision boundary shown might represent the optimal tradeoff between performance on the training set and simplicity of classifier.
Modeling using Supervised Learning

Training data
lightness	width	category
1.5	14.6	salmon
7.3	15	Sea bass
...

Latihan

Tentukan apakah pernyataan berikut benar atau salah; dan jika salah tuliskan pernyataan yang seharusnya.
a. Pembelajaran induktif adalah proses pembelajaran yang menerima pasangan input dan output untuk menemukan hampiran fungsi target. **benar**

b. Hasil pembelajaran induktif yang menghasilkan klasifikasi sempurna untuk data training [pasti] memberikan hasil klasifikasi sempurna juga untuk prediksi 'unseen data'. **salah**

↳ *belum tentu. kalau overfit mungkin ndak sempurna*

Tentukan apakah task berikut ini termasuk klasifikasi atau regresi.
a. Terdapat hasil suatu algoritme pembelajaran induktif yang berupa formula batas keputusan (decision boundary). Jika hasil penerapan formula pada suatu data bernilai >= 0.5, maka data tersebut diberi label 1 yang menyatakan 'hate speech'; jika bernilai < 0.5 maka data tersebut diberi label -1 yang menyatakan bukan 'hate speech'. **klasifikasi**

domain terbatas

b. Hasil algoritme pembelajaran digunakan untuk memprediksi fluktuasi harga masker berdasarkan sejumlah atribut/ fitur yang berkaitan dengan tingkat viralitas penyakit Covid-19. Hubungan antara atribut/ fitur tersebut dan harga masker bersifat linear. **regresi**

domain kontinu, gaj terbatas

harga masker bisa berapapun

c. Sebuah algoritme pembelajaran menerima ulasan mengenai suatu produk, dan dipelajari untuk menentukan rating (1, 2, 3, 4, atau 5) dari aspek tertentu pada produk tersebut. **klasifikasi**

↳ *ratingnya cuman dr 1 - 5 (terbatas)*
